This is your reaction when you examine the SRS.

You understand nothing, learn nothing & produce zero test cases!

You reach your supervisor /client to walk you through the requirements. But your client is busy. He does not have the time to get over the phone with you to walk you through the requirements. Instead, he forwards you a [Mockups](#) created by his designers for the project.

Go ahead and cross relate the mockups with the SRS document to understand the project.

Hope you create a few test cases!

**Cheers**

Team guru99

### **PRO TIP:**

- 1) It's a good practice to ask the client for as many project related documents as possible. He may forget to forward you some documents.
- 2) Requirements walkthrough gives you an opportunity to raise defects if any, in the requirements phase itself where they are cheapest to fix. Refer this [link](#) for more on this
- 3) In theory, all testing projects must follow the exact stages defined in the [STLC](#). In practice, this is not always possible due to budget, manpower, time constraints. A STLC stage could be cut-short or ignored all together

### **NOTE:**

- Soon you will receive Test cases prepared by our experts
- Here a detailed [FAQ](#) on the SRS document
